

## WRITING TASK 1

You should spend about 20 minutes on this task.

*The line graph below gives information on cinema attendance in the UK.*

*Summarise the information by selecting and reporting the main features, and make comparisons where relevant.*

Write at least 150 words.

The line graph illustrates the percentage of people in four different age groups who attended the cinema in the UK over a 20-year period from 1990 to 2010.

Overall, what stands out from the graph is that cinema attendance was most popular among the older age groups, while the youngest group consistently had the lowest participation rate. Another significant feature is that all four groups followed a remarkably similar trend, experiencing a dip around the year 2000 before rising in the following decade.

Looking at the details, the 44-54 age group started with the highest proportion, at just under 40% in 1990. After a slight dip, this figure rose steadily to finish at a peak of just over 50% in 2010. Similarly, the 34-44 age group began at approximately 35, then saw a drop to around 32% in 2000, climbed to about 44% by the end of the period.

In contrast, the younger demographics showed lower attendance figures. The percentage of people aged 24-34 fluctuated in the first decade, starting at 24% before rising and then falling to a low of 23% in 2000. It then saw a steady increase to roughly 33% in 2010. The 14-24 age group, representing the least frequent cinema-goers, started at 15% and, following the same pattern, ended at a higher point of approximately 21%.

## WRITING TASK 1

You should spend about 20 minutes on this task.

**The chart below shows percentages of young people choosing different ways to solve the global warming in four different countries in 2008.**

**Summarise the information by selecting and reporting the main features, and make comparisons where relevant.**

Write at least 150 words.

The provided bar chart illustrates proportions of young people choosing different ways to solve the global warming in four different countries in 2008.

Overall, it is clear that altering lifestyles and implementing government regulations were the two most favoured strategies in the majority of the countries surveyed. In stark contrast, Holland stands out, as the most common response among its youth was that none of these solutions were suitable.

Focusing on the two most popular methods, over 40% of young people in Portugal chose changing their lifestyle, the highest figure in the chart. Similarly, government regulations were also a very popular choice in Portugal, selected by 40% of its youth. In Poland, these two options were also the top choices, though at lower proportions of approximately 26% and 30% respectively.

Conversely, advanced technology was generally the least popular solution, with only around 10% of young people in Poland and Holland choosing this method. The "None of these" category reveals an interesting trend. This was the most selected option in Holland, at 30%, and was also very high in Poland, at 25%. The figures for these two categories were generally lower in Portugal and Romania.

**WRITING TASK 1**

You should spend about 20 minutes on this task.

**The table below shows information about the CO<sub>2</sub> production released by five countries that produced the most in 2006.**

**Summarise the information by selecting and reporting the main features, and make comparisons where relevant.**

Write at least 150 words.

| Average (Per Person) |         | Amounts (Million Tons) |      |                |
|----------------------|---------|------------------------|------|----------------|
|                      |         | 2005                   | 2006 | Rate of Change |
| China                | 4.8 Kg  | 5600                   | 6000 | 11%            |
| US                   | 19.8 Kg | 5900                   | 5000 | -2%            |
| Russia               | 12 Kg   | 1699                   | 1699 | 0              |
| India                | 1.2 Kg  | 1200                   | 1300 | 8%             |
| Japan                | 9.8 Kg  | 1100                   | 1100 | 0              |

The table illustrates the CO<sub>2</sub> emissions of the five highest-producing countries in 2005 and 2006, along with per capita figures for 2006.

Overall, it is clear that China and the US released significantly more CO<sub>2</sub> than Russia, India, and Japan in terms of total volume. However, the pattern was different for per capita emissions, where the figures for China, India, and Japan were considerably smaller than those of the other two nations.

Regarding the countries with the largest emissions, the US produced 5900 million tonnes of CO<sub>2</sub> in 2005. This figure then decreased by 2% to 5000 million tonnes in 2006, despite the nation having the highest per capita output at 19.8 kg. In contrast, China's average personal production was relatively small at 4.8 kg, whereas its total emissions grew from 5600 to 6000 million tonnes in the following year, a significant increase of 11%.

Turning to the remaining countries, Russia's output remained stable at 1699 million tonnes, with a per capita figure of 12 kg. Similarly, Japan's production was also unchanged at 1100 million tonnes, and its individual output was 9.8 kg. Lastly, India had the lowest per capita production at just 1.2 kg, yet its total emissions saw a substantial 8% rise to 1300 million tonnes.

## WRITING TASK 1

You should spend about 20 minutes on this task.

**The charts below show the percentage of water used for different purposes in six areas of the world.**

**Summarise the information by selecting and reporting the main features, and make comparisons where relevant.**

Write at least 150 words.

**Percentage of water used for different purposes in six areas of the world**

The provided pie charts illustrate how water is used for three different purposes—industrial, agricultural, and domestic—across six regions of the world.

Overall, it is clear that agriculture is the primary category of water consumption in South America, Africa, Central Asia, and Southeast Asia. In contrast, industrial use is the dominant factor in the water consumption of North America and Europe.

Regarding the four agriculturally dominated regions, this sector accounts for over 80% of water usage in Africa (84%), Central Asia (88%), and Southeast Asia (81%). The proportion is slightly smaller in South America, at 71%. In these four regions, domestic use consistently represents a small fraction, though it is notably higher in South America (19%) compared to the others (7-9%).

Turning to the remaining two regions, the pattern is reversed. Industrial water consumption is the largest category in both North America and Europe, at 48% and 53% respectively. Agricultural use, while significant, accounts for a smaller share (39% in North America and 32% in Europe). Finally, domestic water use in these two developed regions stands at 13% and 15%.

## WRITING TASK 1

You should spend about 20 minutes on this task.

**The maps below show the centre of a small town called Islip as it is now, and plans for its development.**

**Summarise the information by selecting and reporting the main features, and make comparisons where relevant.**

Write at least 150 words.

The maps demonstrate the present and planned future layout of the town center of Islip. Supported by new infrastructure and facilities, the area covered and the capacity for both shoppers and residents will increase.

One prominent planned change is on the roads – the main road going through town center from west to east will be replaced by a dual carriageway that surrounds the whole town center, covering a larger area. In addition, the section of main road inside the dual carriageway will be converted into a pedestrian street. Shops currently stand on the northern side of main road will all be demolished (those on the south side unchanged), and the larger new enclosed space in the north between the pedestrian street and carriageway is intended for a new bus station, larger shopping center, car park, and housing area with a pathway out.

The original housing area in the south also will experience changes: it will be divided into two sections by the new dual carriageway with new housing development in the upper enclosed area; the park originally in the southeastern corner of town center will also be enclosed and shrink in size.

## WRITING TASK 1

You should spend about 20 minutes on this task.

**The diagram below shows how electricity is generated in a hydroelectric power station.**

**Summarise the information by selecting and reporting the main features, and make comparisons where relevant.**

Write at least 150 words.

The given diagram illustrates the step-by-step process of how electricity is generated in a hydroelectric power station.

Overall, it is clear that this is a cyclical process, which involves two main stages: generating electricity during the day and pumping water back at night.

To begin with, water from a river is stored in a high-level reservoir, held back by a large dam. During the day, an intake opens, allowing this water to flow downwards through a large pipe towards the power station. Inside the station, the force of the flowing water turns reversible turbines. These turbines, in turn, drive a generator, which produces electricity. This electricity is then sent via power lines to the national grid. After passing through the turbines, the water is released into a low-level reservoir.

Conversely, at night, the process reverses. The intake from the high-level reservoir is closed. Water is pumped from the low-level reservoir back up into the high-level reservoir. This pumping action is also carried out by the reversible turbines, which now function as pumps. Once the water returns to the high-level reservoir, the entire process can begin again the next day.

## WRITING TASK 1

You should spend about 20 minutes on this task.

*The diagram below shows the process for recycling plastic bottles.*

*Summarise the information by selecting and reporting the main features, and make comparisons where relevant.*

Write at least 150 words.

The diagram illustrates the step-by-step process by which plastic bottles are recycled.

Overall, it is clear that the recycling of plastic bottles is a cyclical process that encompasses nine distinct stages, starting from public waste disposal and ending with the manufacturing of new goods.

The process begins when members of the public discard their used plastic bottles into designated recycling bins. Following this, the bottles are collected by a specialized truck and transported to a recycling centre. At the centre, workers sort the bottles by hand to separate those suitable for recycling.

In the next stage of the process, the sorted bottles are compressed into large blocks. These blocks are then fed into a crushing machine, which breaks them down into small pieces. After being crushed, these pieces are thoroughly washed in a tank to remove any impurities.

The final stage involves manufacturing. The clean plastic pieces are processed in a machine to produce pellets. Subsequently, these pellets are heated to create a raw material, which is then used to manufacture a variety of new end products, such as bottles, T-shirts, and bags. Once used and discarded, these items can re-enter the process, thus completing the cycle.
